ILA-34 Conference and Technical Symposium

Santa Barbara, California

October 19, 2005

Overview

- Use of locally measured and/or calculated ASF values is key for Loran C to meet accuracy requirements of RNP (0.3)
- Ohio University has been collecting Loran C data at six east coast/mid west airports over the past two years
- Flights are conducted in early spring and late summer seeking to establish patterns for ASF values
- Goal is to verify if a single set of ASF values can serve an entire airport covering all runway approaches

Outline

- Loran-C Signal Propagation
- ASF Measurement System
- ASF* Derivation
- Required Navigation Performance
- Flight Test Results
- Summary and Conclusion

Loran C Signal Propagation

- “Primary” factor (PF) is signal delay through the atmosphere as compared to a vacuum
- “Secondary” factor (SF) is signal delay over seawater
- “Additional” secondary factor (ASF) accounts for additional delays over terrain due to ground conductivity (moisture/temperature dependent)
- ASFs contribute largest positional errors for Loran and their incorporation is essential for local accuracy

ASF Measurement System

- 2 SatMates (E and H-field)
- 12 channel GPS/WAAS
- Notebook PC with ASF software utility for rapid on-site ASF calculation
- Flashcard for easy data storage and transfer to the aircraft receiver
- UPS/ruggedized unit for field use

ASF* Derivation

- Collect ~ 1 hour Loran and GPS data at airport site
- ASF software utility generates local ASF* values
 - TOAs are measured using Loran C receiver clock locked to a composite frequency derived from all stations being tracked
 - Measured TOAs are differenced from TOAs calculated using GPS-derived position and the PF and SF yielding AFS*
 - ASF* contains UTC offset, receiver delays
 - Common receivers (ground/air) are used to account for the receiver delays
 - Loran C system is well managed and UTC offsets within the system remain reasonably constant over time
- Second utility reads ASF* values and burns flashcard
- Flashcard is used to initialize aircraft Loran C receiver

ASF System in Operation

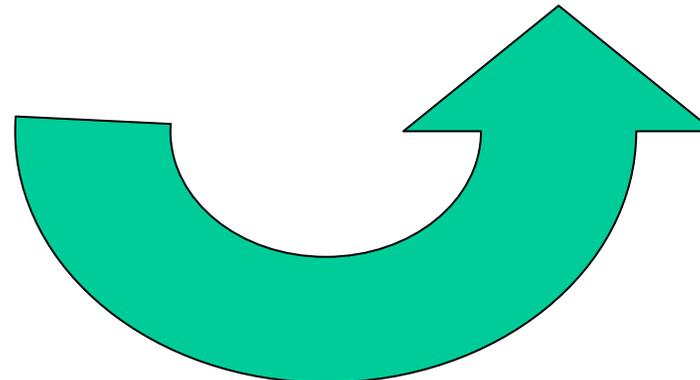

- ASF Measurement System
- Tripod holds GPS, E-field and H-field Loran antennas
- Shown here in operation at Jacksonville, Florida
 - Craig Municipal Airport

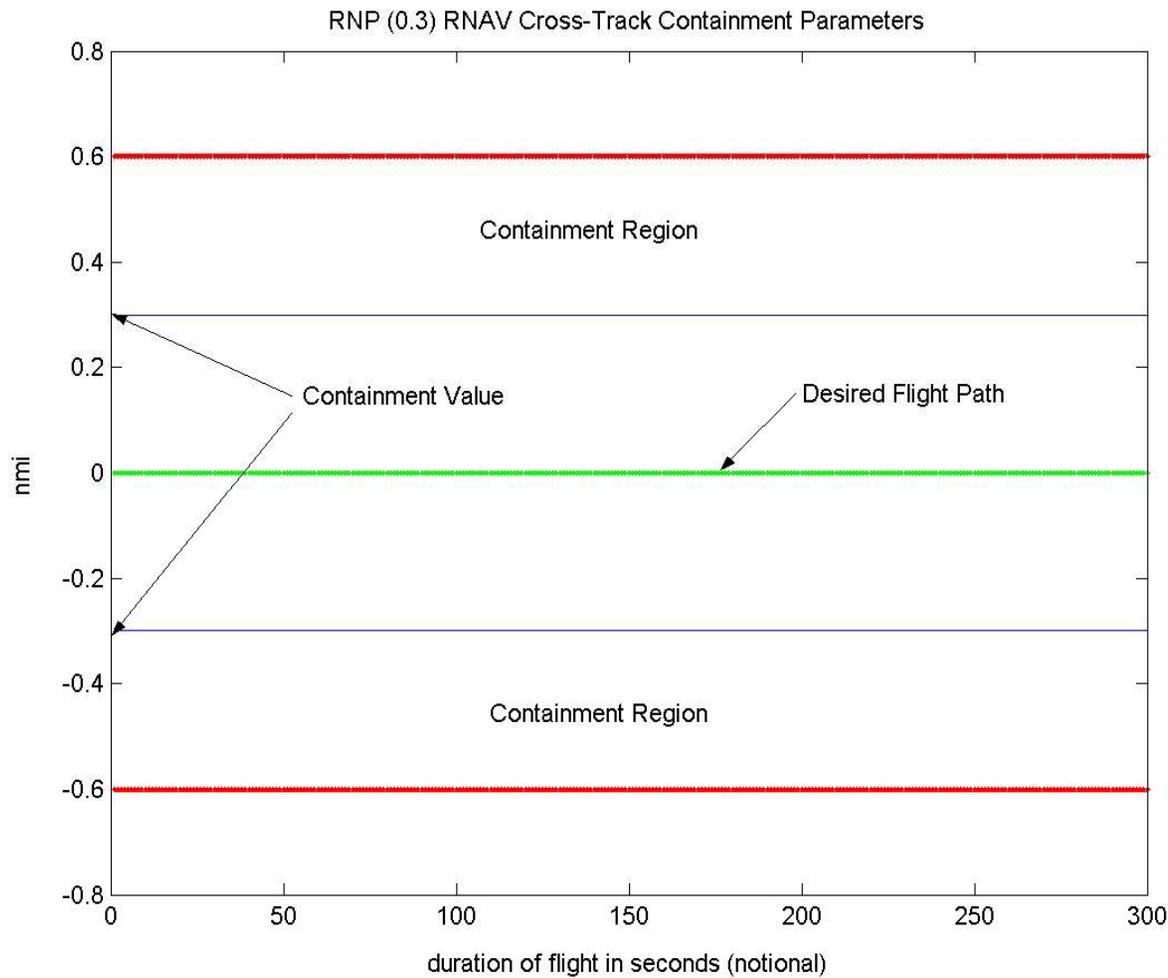

Example ASF* File for an Airport

Typical ASF* values:

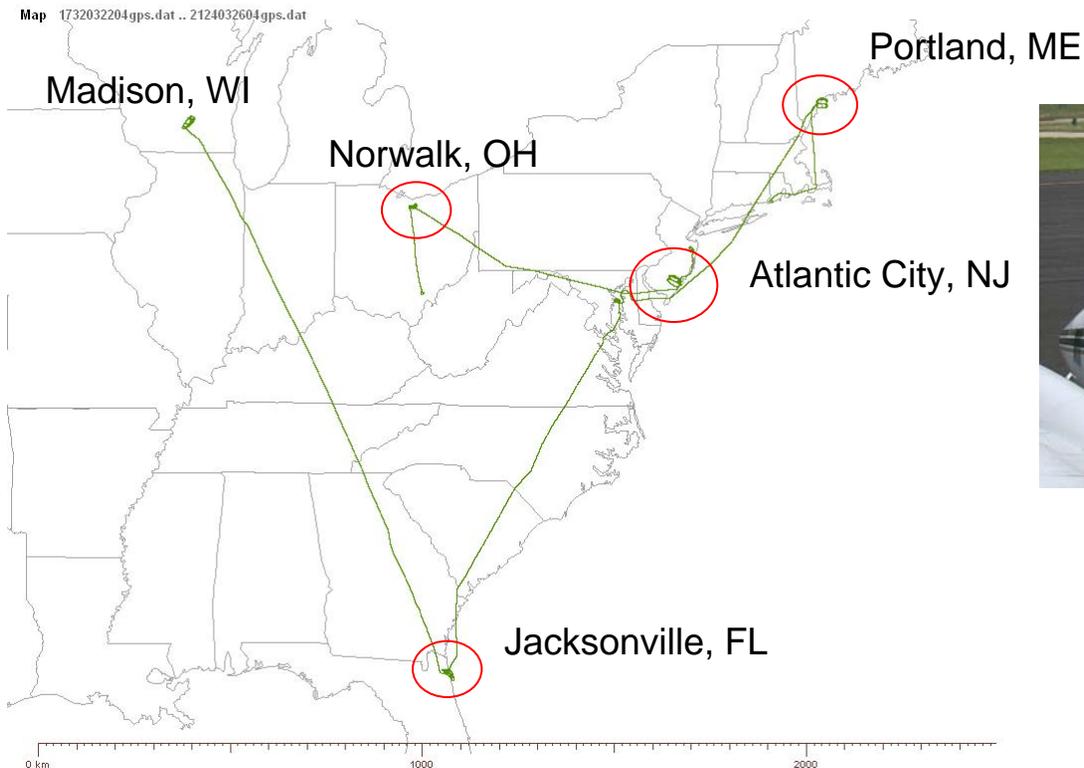

```
#ASF 8970M -0.906us [13500]
#ASF 8970X 0.429us [13498]
#ASF 8970Y 0.685us [13500]
#ASF 9960M 0.39us [13500]
#ASF 9960W 27.5us [8]
#ASF 9960Z -0.83us [13500]
#ASF 9960X 2.18us [13314]
#ASF 8970W 2.88us [13486]
#ASF 7980M -0.589us [13456]
#ASF 7980W -1.4us [13470]
#ASF 8970Z 0.118us [13468]
#ASF 7980Z -0.271us [13444]
#ASF 8290M 0.324us [13450]
#ASF 8290W 0.665us [13456]
#ASF 8290X 0.24us [13364]
#ASF 9610X 0.495us [12358]
#ASF 9610Y 0.523us [11932]
#ASF 9960Y 2.56us [13220]
#ASF 9610M -1.49us [13064]
#ASF 9610V -0.846us [13064]
#ASF 9610Z 0.261us [13064]
#ASF 7980X -0.544us [11690]
#ASF 7980Y 0.799us [6610]
```

Required Navigation Performance (RNP) 0.3 (From RTCA DO-236B)

Flight Tests From March 2004

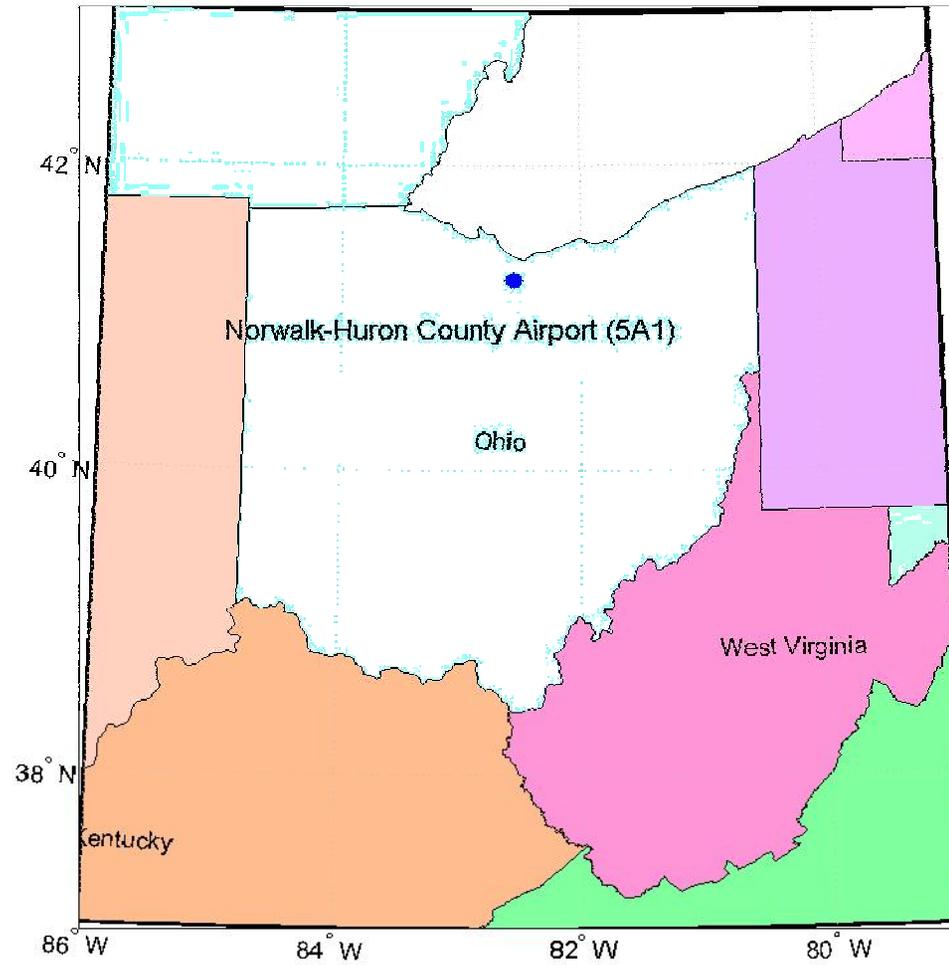

Ongoing flight tests performed by Ohio University's Avionics Engineering Center (AEC) using King Air, C-90SE twin turboprop

Flight Test Results from Four Locations

- Norwalk-Huron County Airport (5A1) Ohio
- Atlantic City International Airport (ACY)
- Portland International Jetport (PWM)
- Craig Municipal/Jacksonville Airport(CRG)

5-nmi Approaches to Runway 32 at CRG--9/1/05

5-nmi Approaches to Runway 32 at CRG--9/1/05

Summary

- Locally generated ASF* measurements demonstrate year-to-year (temporal) consistency but trials to date are limited.
- Flight measurements demonstrate that cross-track error is well behaved for stabilized approach procedures typical of those published by FAA for non-precision approach
- Numerous flight tests (these and others previously reported) have demonstrated RNP 0.3 performance over a wide area surrounding the point where ASF* values were generated.
 - with ASF corrections derived the same day
 - with ASF corrections several months old

Conclusions

- It appears that a single set of ASF* values per airport will be sufficient to meet RNP 0.3 accuracy requirements for all runway ends.
- Twice annual updates may be needed for some airports where all-in-view geometry is limited.
- Airports surveyed to date are representative of those east of the Rocky Mountains. The inter-mountain and west coast areas need to be studied since ASF gradients can be steep.
- With new TFE equipment in place and a move to time-of-transmission control, ASFs should prove to be more stable than at present thus yielding even greater Loran C accuracy.
