**PRESENTED BY:**

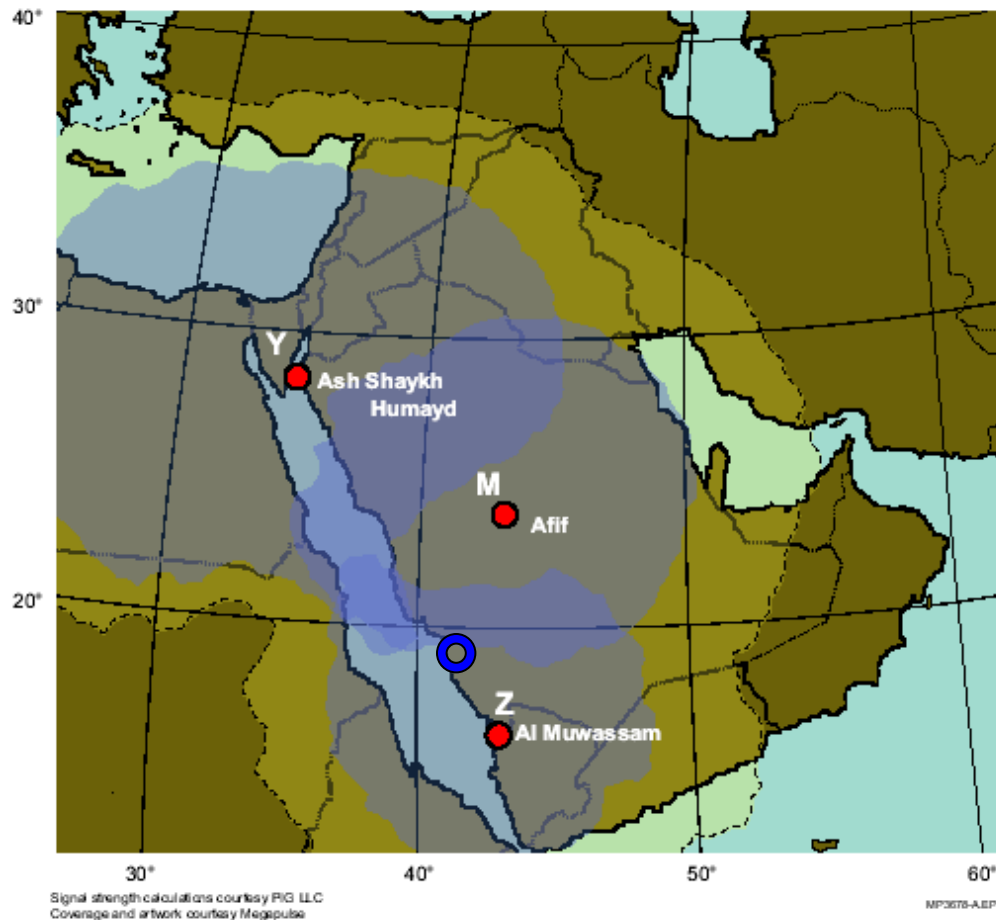

**Erik  
Johannessen**

---

# Overview

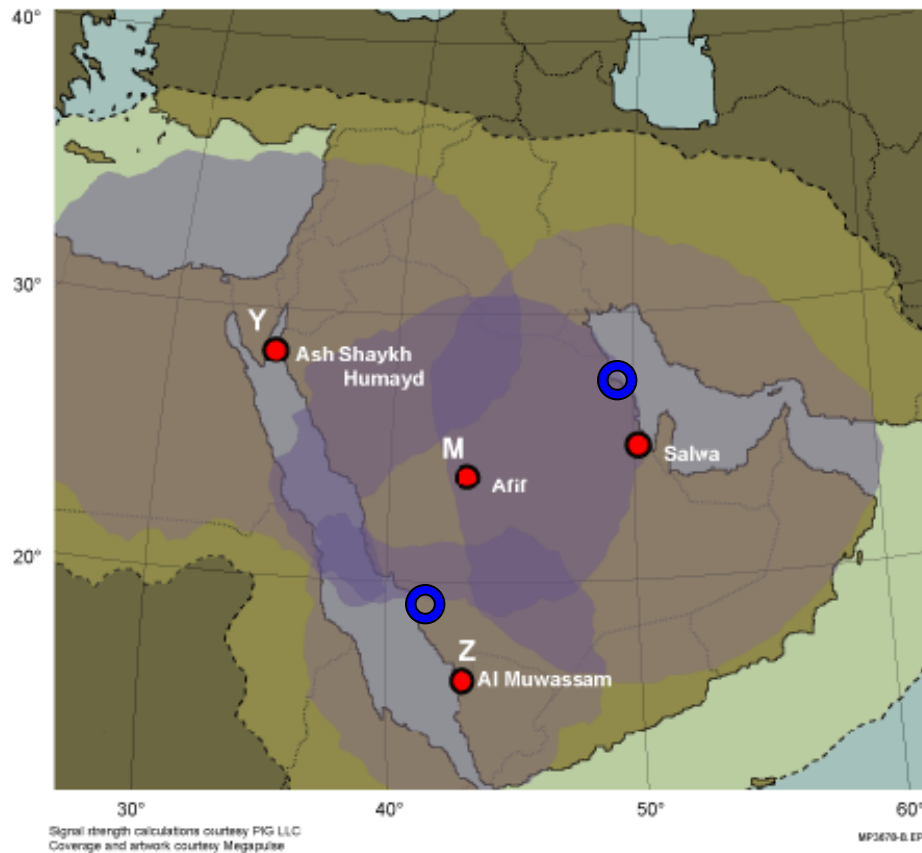

- Saudi Sea Ports Authority (SEAPA) is responsible for the Loran service in Saudi. Contracted O&M is renewed on a three year basis via competitive tender among Saudi firms.
- The latest 3 year contract began in Jan 2007.
- System modernization is part of the scope.
- Included in the current project is:
  - Upgrading system clocks
  - Modernization of Chain Control Equipment
  - Restoring Loran service at Salwa
  - Adding Eurofix to Salwa
- Delivery to be complete by Jan 2008.

# Present Saudi Positioning System (SPS) Coverage

- 3 stations, each rated at 1MW
- SAM (LRSII) at Qunfudah, south of Jeddah

# Future SPS Coverage

*\*Outer and Inner contours represent 95% and 99% probability of proper message reception and decoding.*

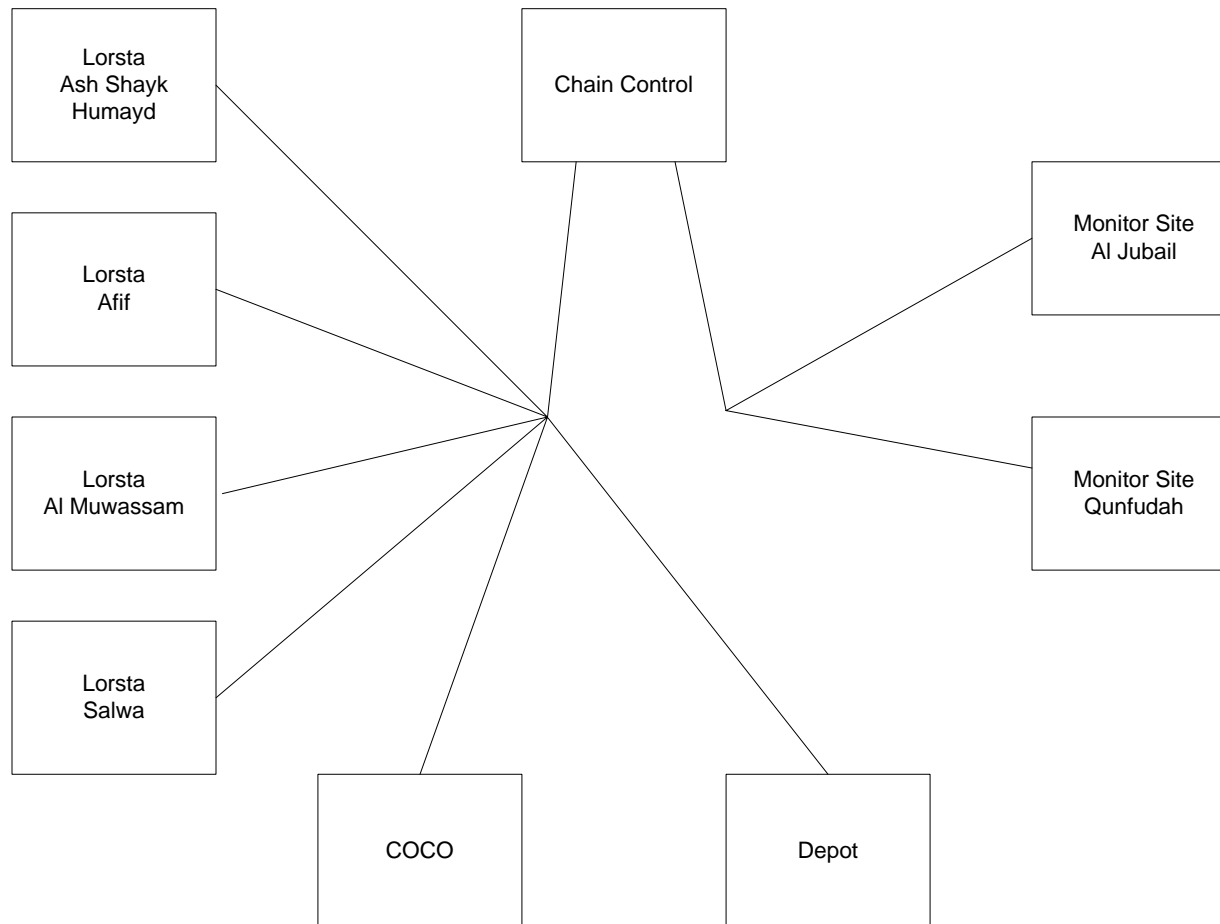

- Restoration of 1MW station at Salwa
- Return of Monitor station at Al Jubail

---

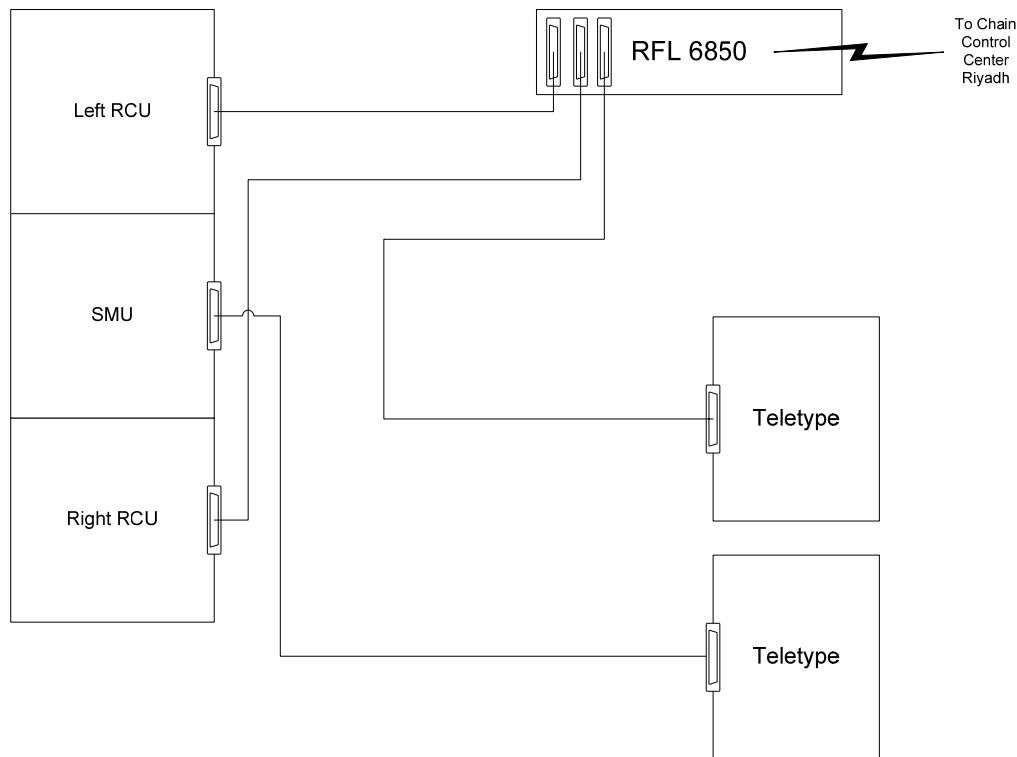

# Modernization of Chain Control Equipment

- Replacement hardware and software performs three different functions roughly divided as:
  - Chain Control Station - receives monitor data on a RS-232 data line, processes the data, display the data, display trends determined from the processing of the data, process alarm data, notify the user of such alarms and archive the data in a format which would allow the data to be fully retrieved.
  - Administrative Teletype - currently an ASR43 teletype (with definable addressing) to be replaced with a combination of hardware and software. Future implementation will include a combination of software and hardware to allow for active monitoring and archiving of the SMU messages.
  - SMU logging - An ASR43 teletype logs the output of the Status Monitor Unit (SMU).
- The present Saudi communications system operates at 110 baud. The networks are setup to allow all stations to be online all the time.
- There are two different networks, one for the administrative station traffic, and the other for the monitor station data.

# Present Inter-site Communication Diagram

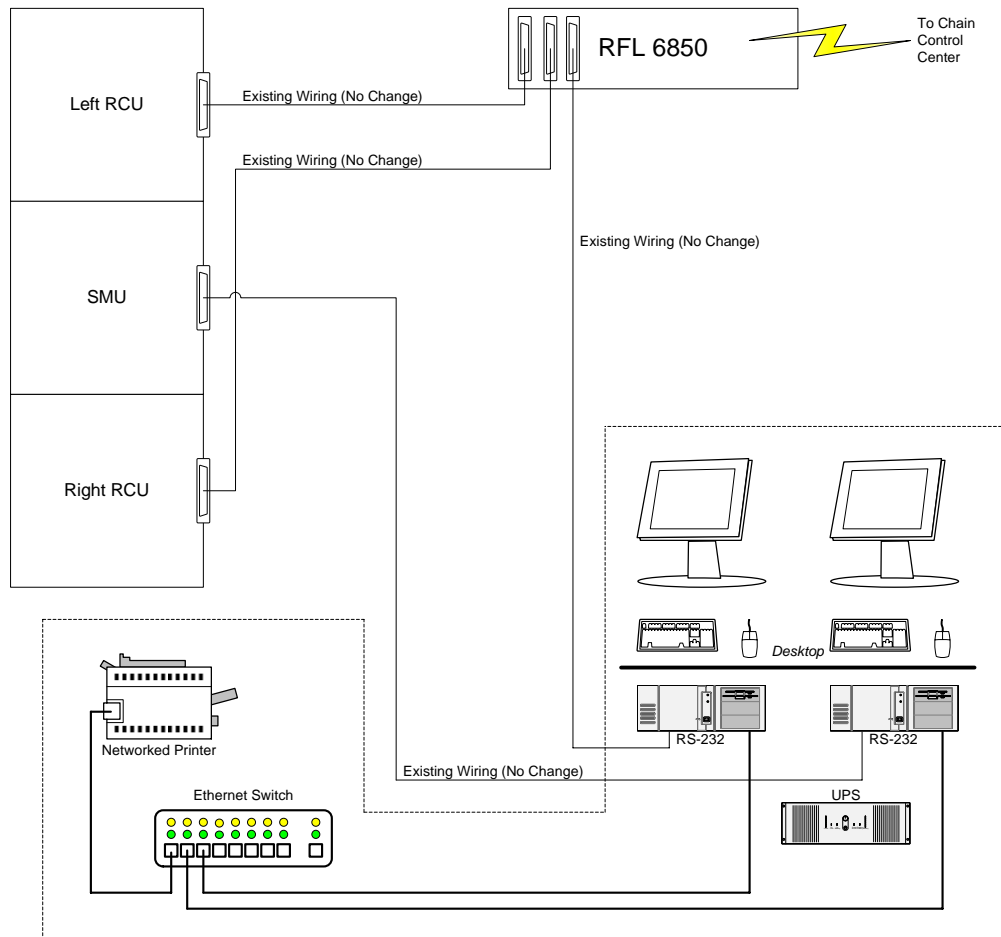

# Present Lorsta Communication Interface

- RFL 6850 converts RS232 to frequency divided channels over a single voice line.

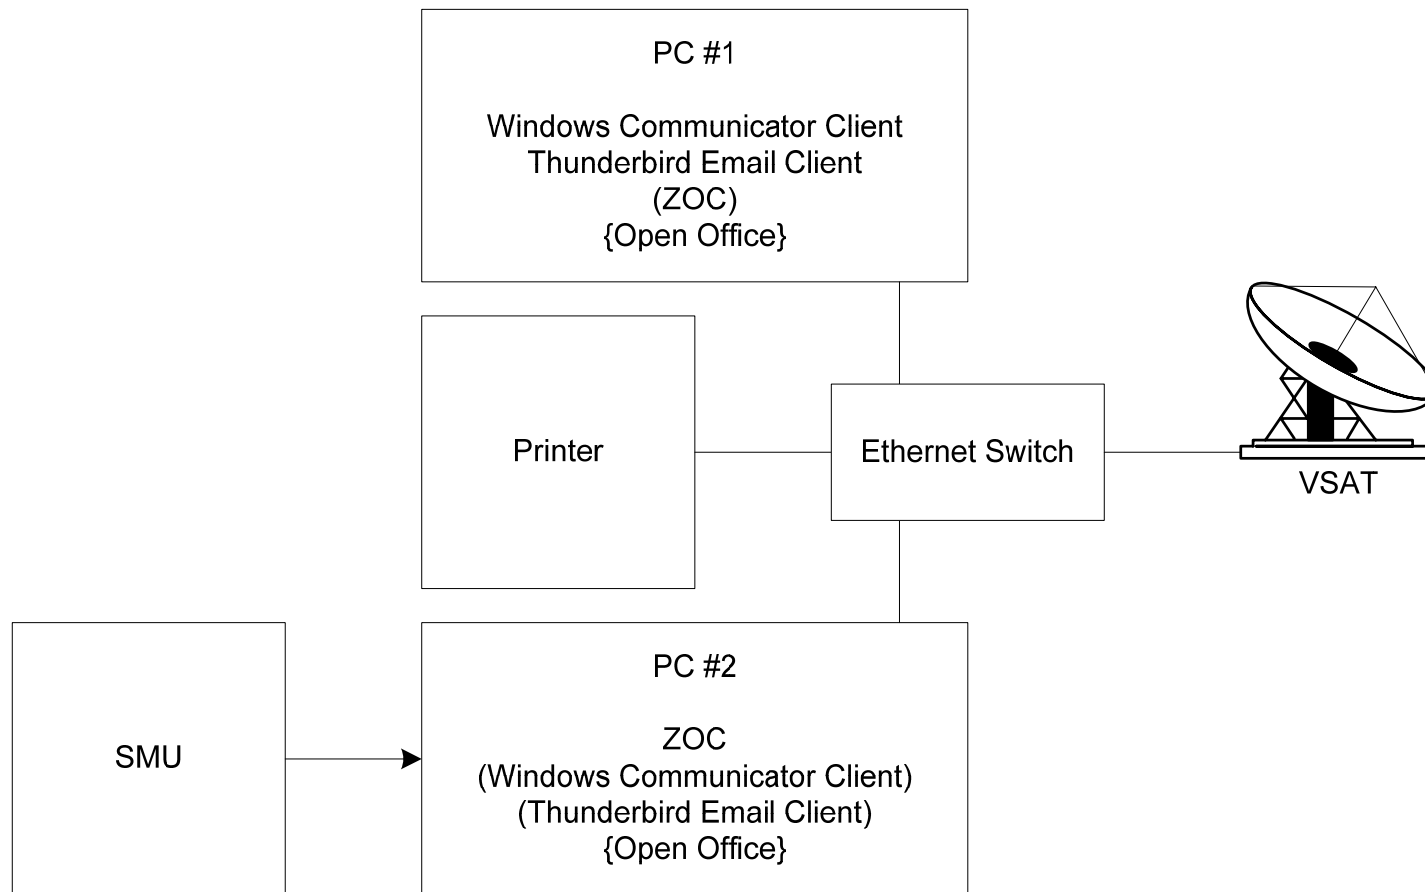

# Proposed Lorsta Architecture

- SEAPA decided to eliminate the RFL 6850 and low data rate with VSAT terminals

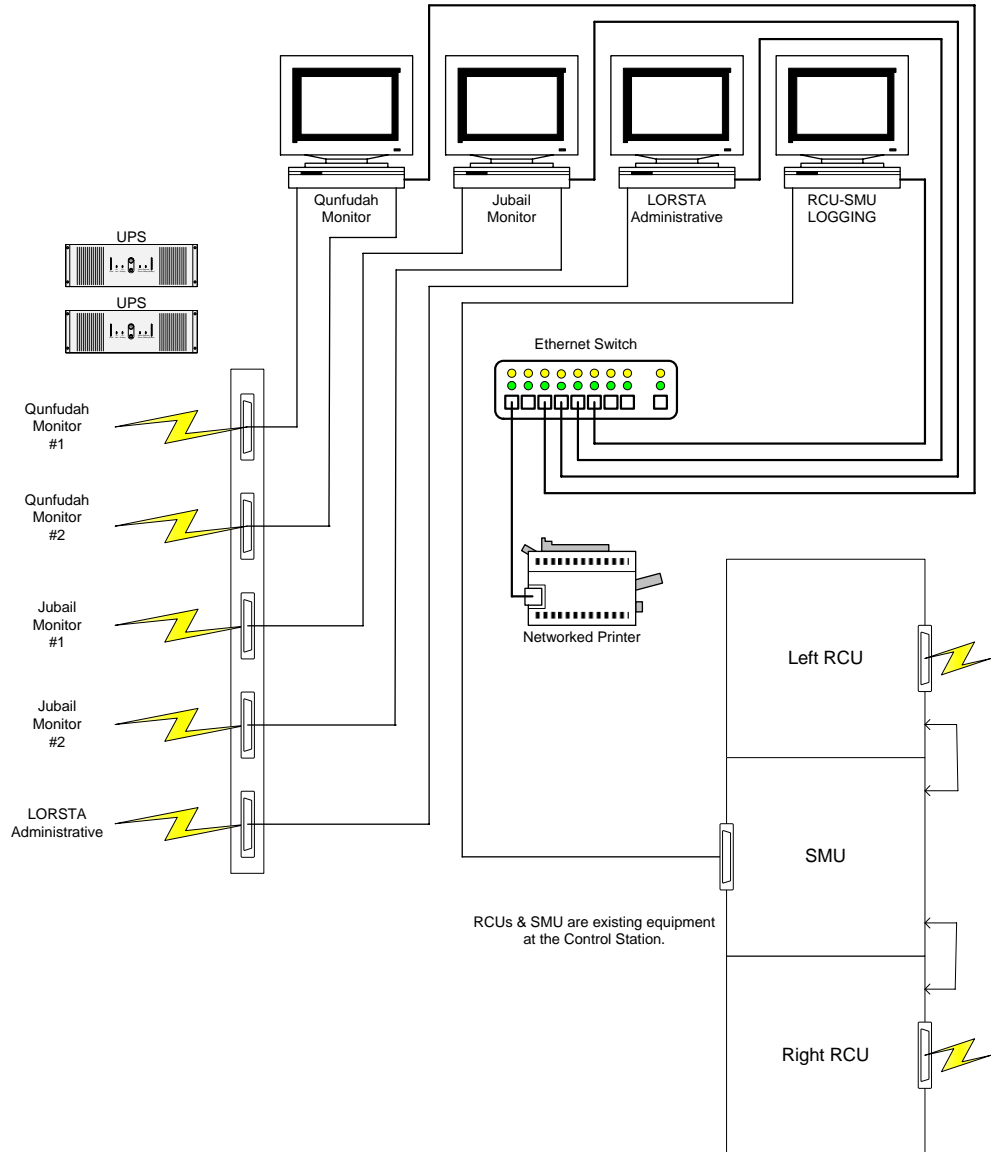

# SMU Logging and Administrative Teletype

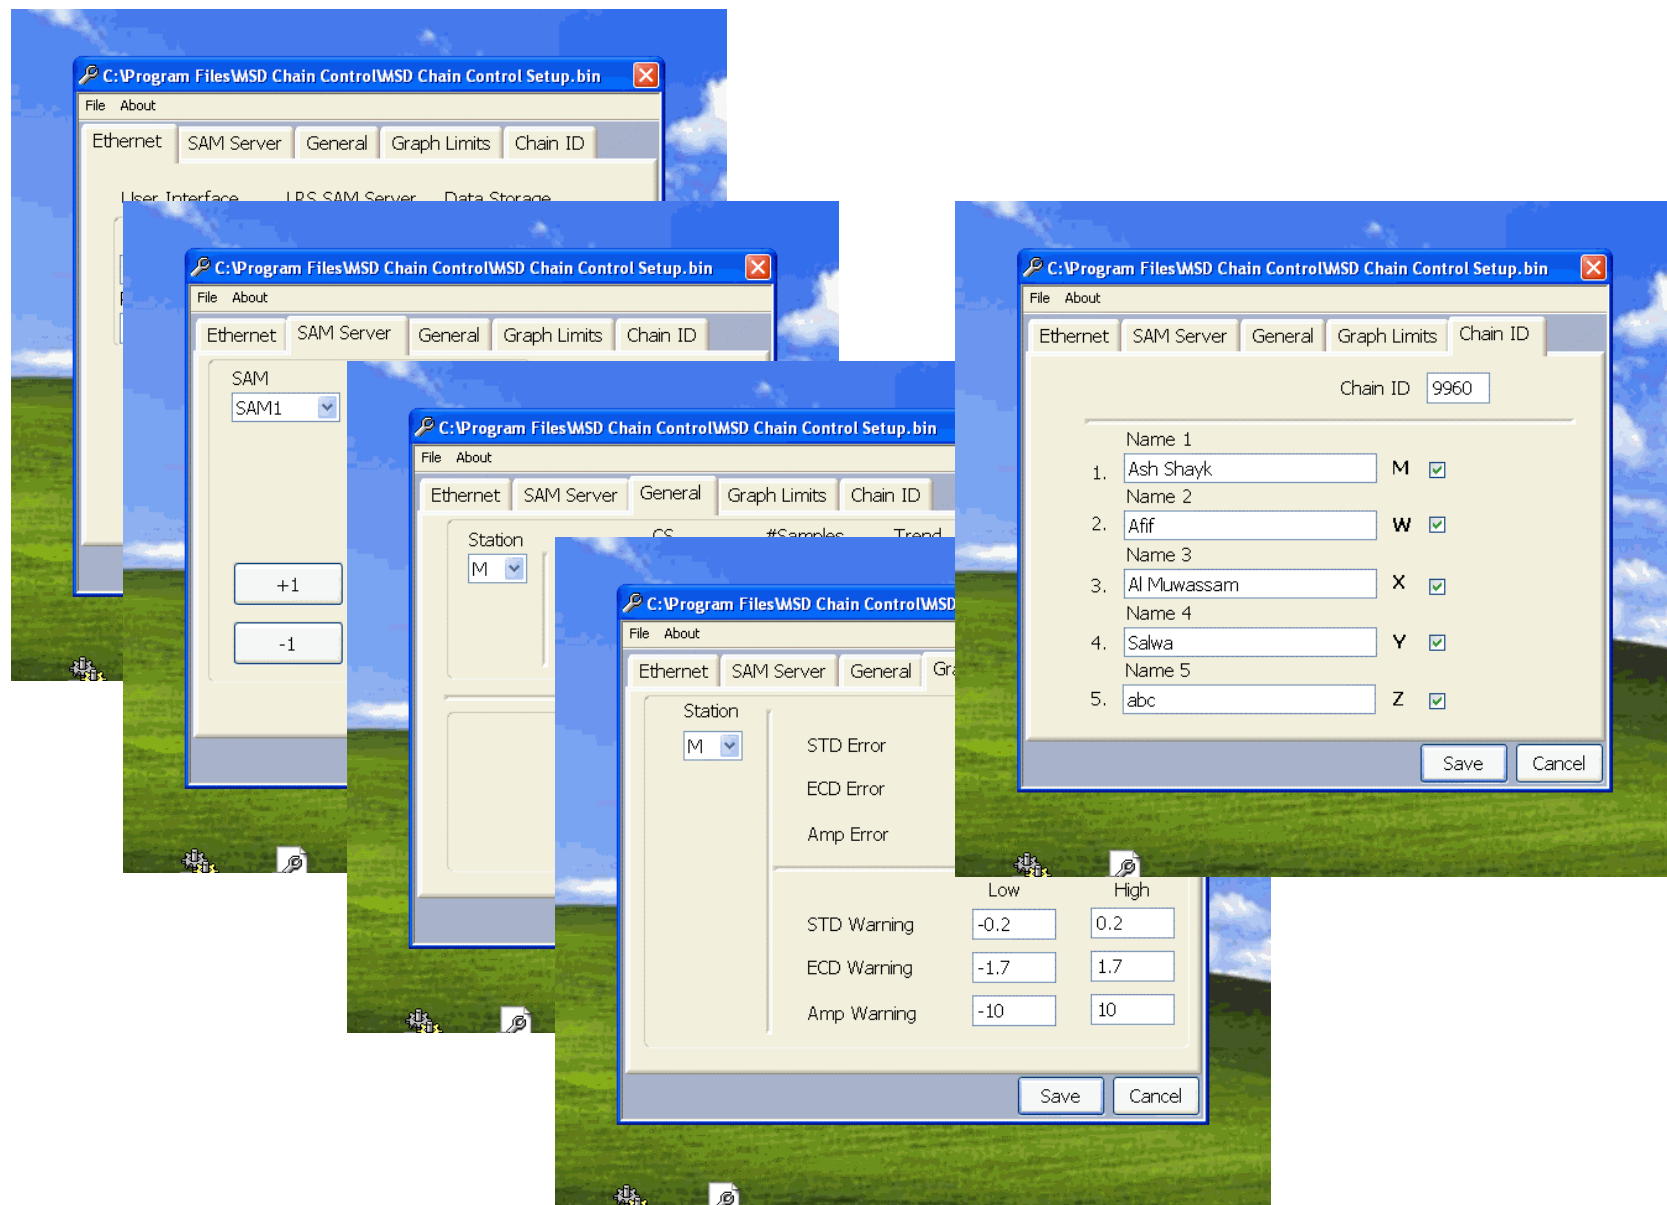

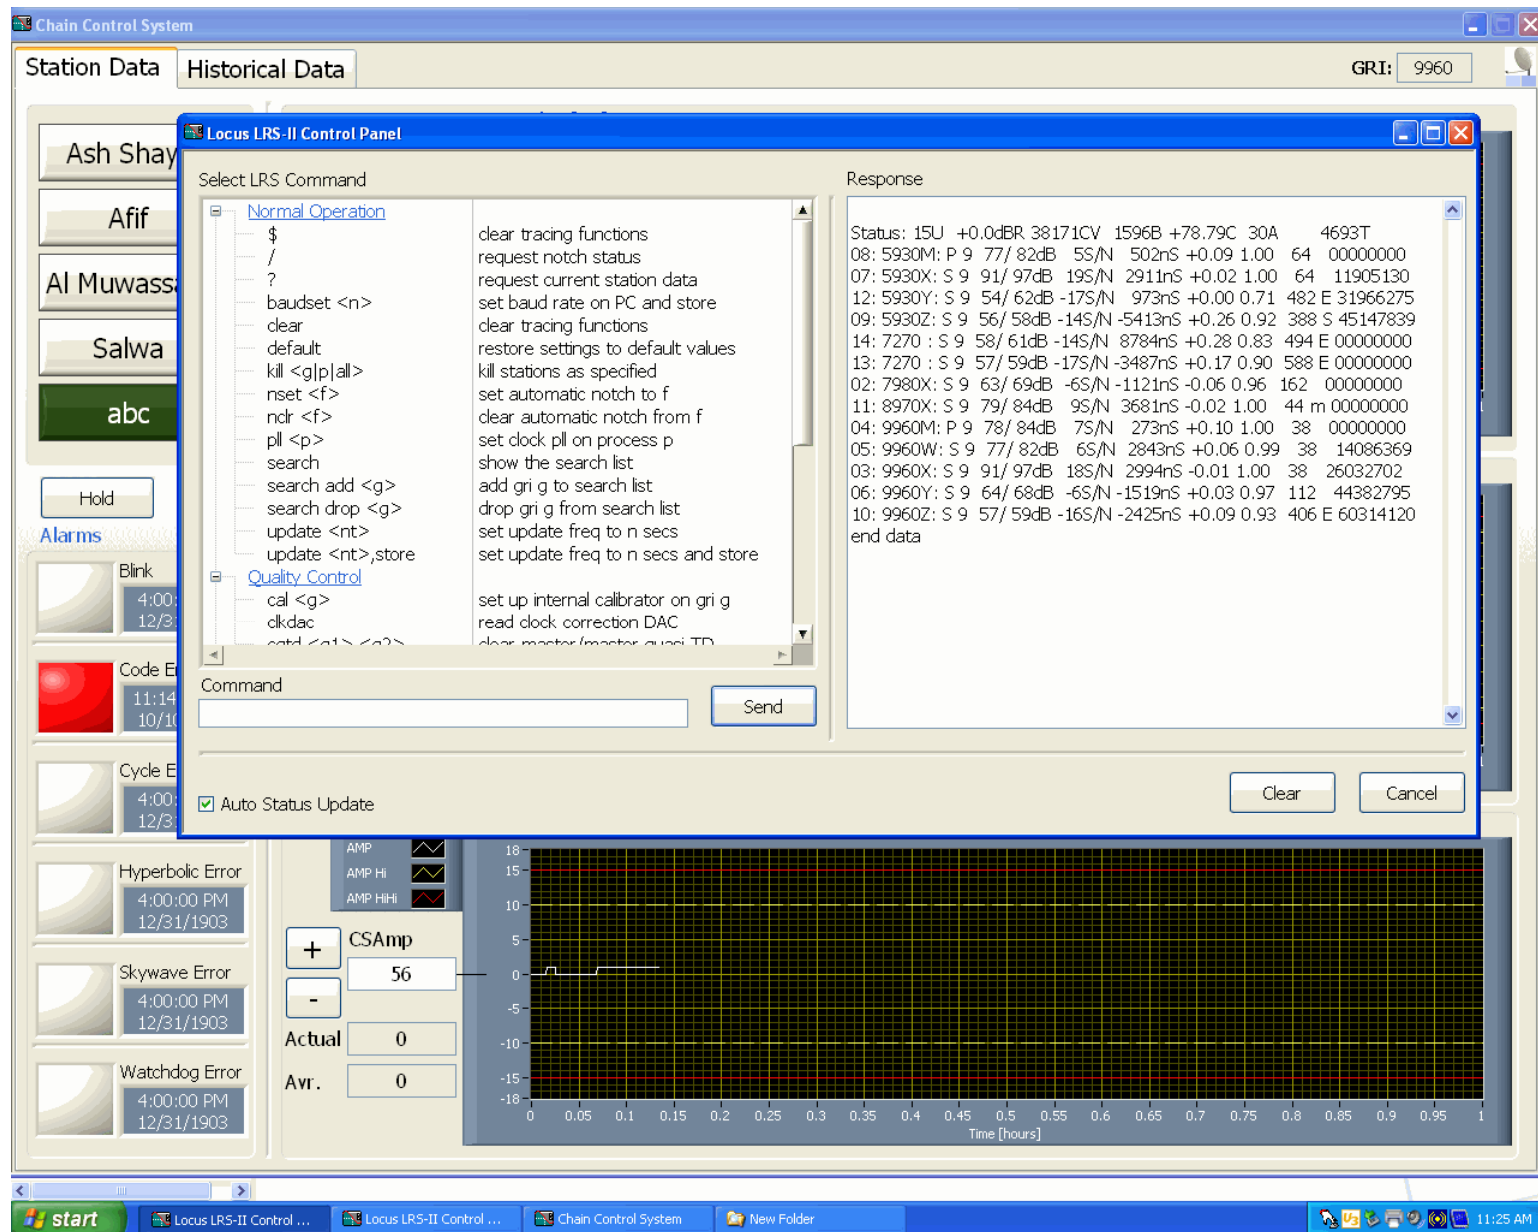

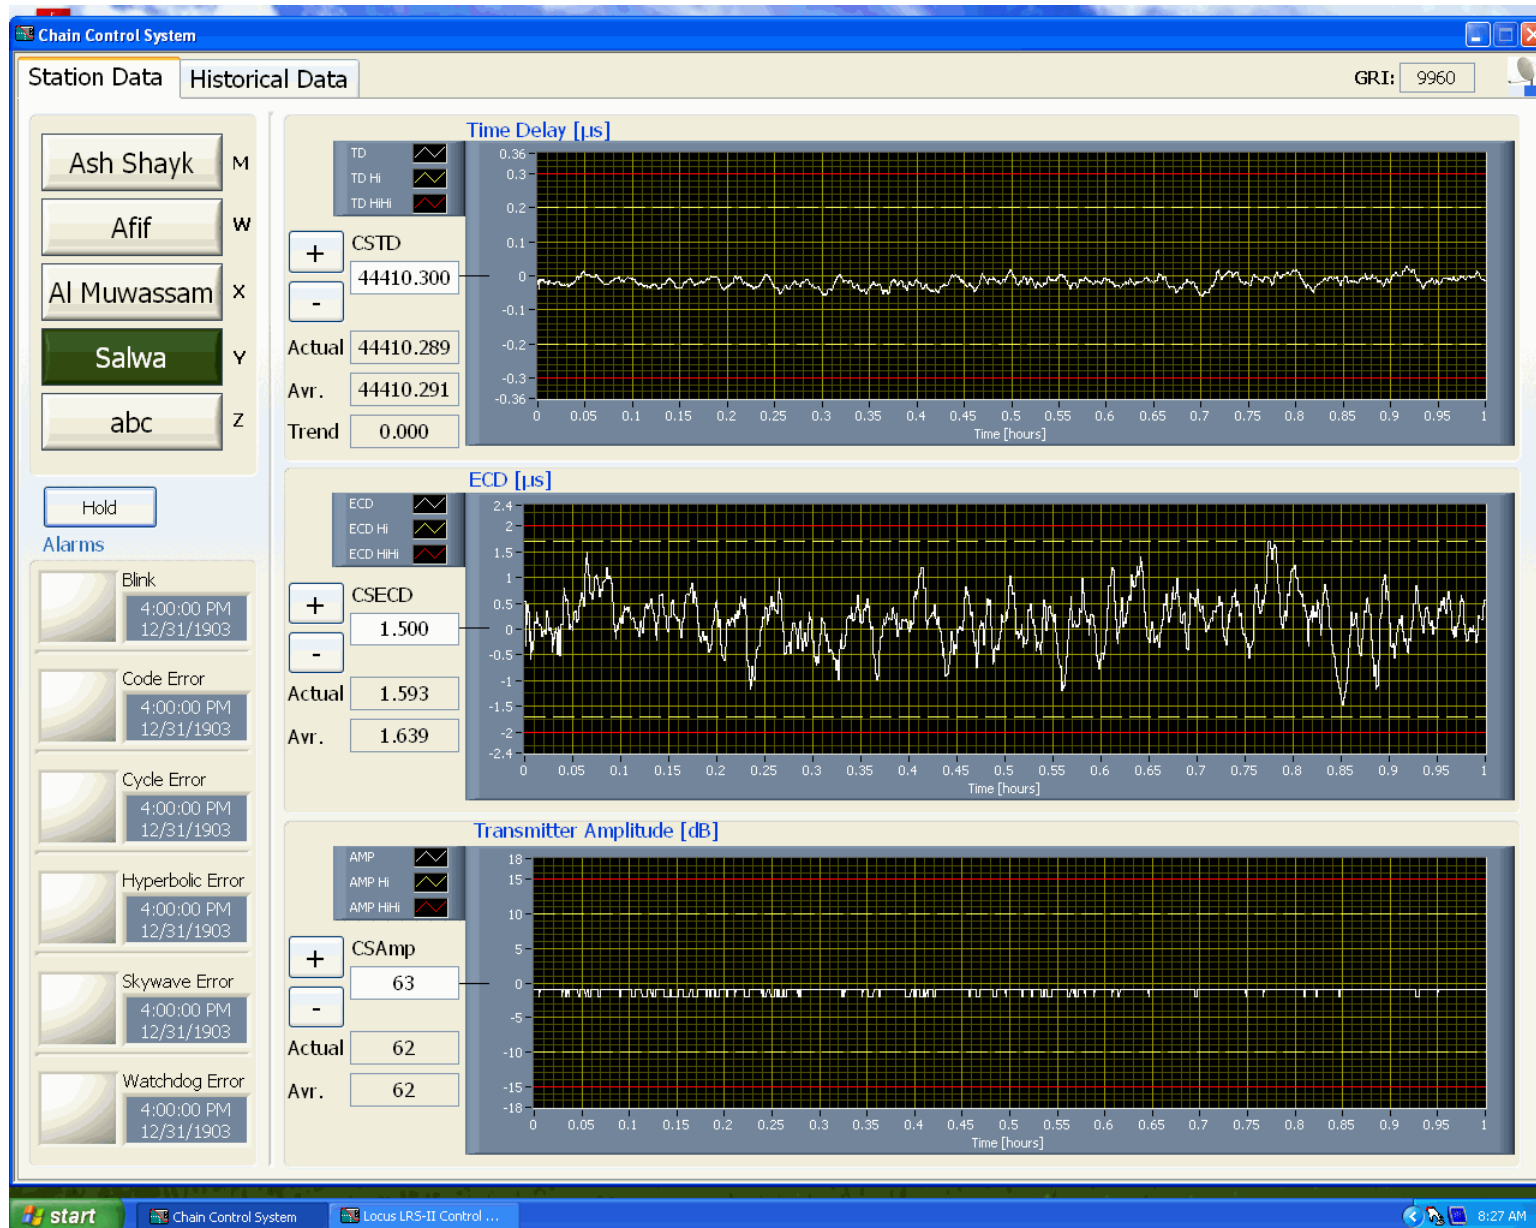

- 

---

# June Trip to Riyadh by John Allen, Megapulse Field Engineer

- Purpose was two fold:
  - Training on replacement Lordac system
  - Site survey of Chain Control Center
  
- Upon arrival, rerouted to Salwa

---

# Summary

- Eurofix hardware shipped in June.
- Chain control hardware shipped in August.
- Due to unavailability of Salwa, delivery of complete 4 station system can not be finalized, requesting contract modification.
- Estimated delay in restoration of Salwa may be as long as 12 months.
